## RISK ASSESSMENT OF CHEMICALS IN THE ENVIRONMENT

Edited by M. L. Richardson, *Chemical Information Group, RSC*

Risk assessment is a multidisciplinary subject with worldwide consequences and this important new book outlines the basic principles involved.

*Risk Assessment of Chemicals in the Environment* is based on the Third FECS Conference on Chemistry and the Environment and provides both up-to-date information and a forum for discussion on the subject.

With worldwide contributions from eminent, internationally known authors, the book covers both chemical and radioactive risk assessment, predictive techniques, risk acceptance (including prediction and reality on isolated and global bases), approaches to the control of chemical disasters and much more . . . It is divided into four sections as follows: Introduction and Overview;

Contribution of Toxicology to Risk Assessment; Incidental Emissions – Air and Water; and Intentional Emissions.

Also included is a glossary of terms, useful addresses and a subject index.

This book will be of great value to scientists and other professionals, whether experts or novices, involved in any aspect of the safety of chemicals in the environment.

**Published 1988**

**Price £59.50 (\$119.00)**

## EXPERIMENTAL TOXICOLOGY

### The Basic Issues

Edited by Diana Anderson, *Head of Genetic and Reproductive Toxicology at British Industrial Biological Research Association* and D. M. Conning, *Director-General of the British Nutrition Foundation*

This important new book is aimed at toxicologists in general and addresses the basic issues concerned with the practice of experimental toxicology.

Principles and methods are discussed in detail, covering experimental design, biochemical issues, animal husbandry, species differences, immunological issues, carcinogenesis, reproductive approaches, statistics, genetics, some *in vitro* and molecular approaches, plus risk assessment, information resources, aspects of legislation, good laboratory practice and laboratory design.

*Experimental Toxicology* will be of great interest to all those practising in the field, as well as to those who wish to gain a basic understanding of what toxicology is all about. It will also be useful to specialists in a other disciplines, who need an introduction to this area.

**ISBN 0 85186 108 3**

**Hardcover 550pp**

**Published 1988**

**Price £69.50 (\$138.00)**

## FOOD – THE CHEMISTRY OF ITS COMPONENTS

### 2nd Edition

By T. P. Coultate, *South Bank Polytechnic*

The *new* 2nd edition of *Food – The Chemistry of Its Components* has been extensively updated and revised, and contains three new chapters covering 'Undesirables', 'Minerals', and 'Water'.

The book provides a detailed account of the chemistry of the principal substances of which our food is composed. Included are the macrocomponents (carbohydrates, lipids, and proteins), which can be classified by their chemical structures, and the microcomponents (colours, flavours, preservatives, and vitamins), which are classified in terms of their function.

Throughout the book Dr. Coultate's theme is the relationship between the chemical structure of a substance and its contribution to the properties and behaviour of foodstuffs – whether observed in the laboratory, factory, kitchen, or dining room.

#### Contents:

Introduction; Sugars; Polysaccharides; Lipids; Proteins; Colours; Flavours; Vitamins; Preservatives; Undesirables; Minerals; Water; Subject Index.

This book will be of particular benefit to students specialising in nutrition, and to students and teachers of food science and related courses in universities, colleges of further education, and schools.

ISBN 0 85186 433 3  
Softcover 338pp

RSC Paperback (1989)  
Price £9.95 (\$19.50)

## BASIC PRINCIPLES OF COLLOID SCIENCE

By D. H. Everett, F.R.S., *University of Bristol*

This new book provides an introduction to colloid science, based on the application of the principles of physical chemistry. Early chapters assume only an elementary knowledge of physical chemistry and provide the basis for more thorough discussion in later chapters covering specific aspects of colloid science.

The widespread occurrence of colloids is stressed and the more important industrial applications of colloid technology are outlined.

The final chapter deals with the future of colloid science and indicates the directions in which further developments are likely to take place. The book is ideal for undergraduate courses and, supplemented by further reading, for postgraduates too. It will also be useful to industrial research workers who wish to become familiar with the basic concepts and their many important applications to industry.

#### Brief contents:

What are Colloids?; Why are Colloidal Dispersions Stable?; I Basic Principles, II Interparticle Forces; How are Colloidal Dispersions Prepared?; What is the Role of Surface Chemistry? Surface Tension and Adsorption; Some Important Properties of Colloids: I Kinetic Properties, II Scattering Radiation, III Rheology; How are Colloidal Dispersions Destroyed?; I Aggregation Processes, II Coalescence and Particle Growth; Association Colloids and Self-Assembly Systems; Thin Films, Foams, and Emulsions; Gels; The Industrial Importance of Colloids; The Future of Colloid Science; Appendix I: Preparation of Some Simple Colloidal Systems; Appendix II: Some Simple Experiments with Colloids; Appendix III: Definitions and Measurement of Adsorption; Appendix IV: The Gibbs Adsorption Equation; Appendix V: Influence of Adsorption on Interparticle Forces; Appendix VI: Steric Stabilisation; Appendix VII: Further Reading; Subject Index.
